Question 1: Calculate the Magnetic Field at a Point Near a Long Current-Carrying Wire

Problem:

A wire carrying a current of 5 A is infinitely long. Find the magnetic field strength at a point 0.03 m from the wire.

Solution:

Using Ampère's Law:

$$B = \frac{\mu_0 I}{2 \pi r}$$

Where:

- $\mu_0 = 4\pi \times 10^{-7} \text{ T} \cdot \text{m/A}$
- $I = 5 \text{ A}$
- $r = 0.03 \text{ m}$

Calculation:

$$B = \frac{4\pi \times 10^{-7} \times 5}{2 \pi \times 0.03}$$

Simplify numerator and denominator:

$$B = \frac{4\pi \times 10^{-7} \times 5}{2 \pi \times 0.03} = \frac{20\pi \times 10^{-7}}{2 \pi \times 0.03}$$

Cancel (π) :

$$B = \frac{20 \times 10^{-7}}{2 \times 0.03} = \frac{20 \times 10^{-7}}{0.06}$$

Final calculation:

$$B = \frac{20 \times 10^{-7}}{0.06} \approx 3.33 \times 10^{-5} \text{ T}$$

Answer:

The magnetic field at 0.03 m from the wire is approximately 33.3 μ T.

Question 2: An Induced emf in a Moving Conductor

Problem:

A straight conductor of length 0.5 m moves at a velocity of 2 m/s perpendicular to a magnetic field of 0.3 T. Find the induced emf.

Solution:

Use the formula for emf induced in a moving conductor:

$$\mathcal{E} = B \times l \times v$$

Calculation:

$$\mathcal{E} = 0.3 \times 0.5 \times 2 = 0.3 \times 1 = 0.3 \text{ V}$$

Answer:

The induced emf is 0.3 volts.

- Step 2: Recognize that R_{series} is in parallel with R_3 :

$$1/R_{\text{total}} = 1/30\ \Omega + 1/15\ \Omega$$

$$1/R_{\text{total}} = (1 + 2) / 30\ \Omega = 3/30\ \Omega = 1/10\ \Omega$$

- Step 3: Invert to find R_{total} :

$$R_{\text{total}} = 10\ \Omega$$

Key Takeaway: Visualize circuit topology, perform stepwise calculations, and double-check unit consistency.

Problem 2: Magnetic Force on a Moving Charge

Scenario: A proton moves at 3×10^6 m/s perpendicular to a magnetic field of 0.5 T. Find the magnetic force acting on it.

Solution:

- Formula: $F = qvB \sin\theta$

Since the velocity is perpendicular, $\sin\theta = 1$.

- Constants:

$$q = 1.6 \times 10^{-19} \text{ C}$$

$$v = 3 \times 10^6 \text{ m/s}$$

$$B = 0.5 \text{ T}$$

- Calculation:

$$F = (1.6 \times 10^{-19} \text{ C})(3 \times 10^6 \text{ m/s})(0.5 \text{ T})$$

$$F = 1.6 \times 10^{-19} \times 3 \times 10^6 \times 0.5 = 2.4 \times 10^{-13} \text{ N}$$

Solution Strategy:

- Use the equations of motion:
- $(v = v_0 + a t)$
- $(s = v_0 t + \frac{1}{2} a t^2)$
- Check units and signs (positive or negative acceleration).

Sample Solution Breakdown:

Suppose a problem states: An object starts from rest with an acceleration of $(2, \text{ m/s}^2)$. Find the displacement after 5 seconds.

- Initial velocity: $(v_0 = 0)$
- Final velocity: $(v = 0 + 2 \times 5 = 10, \text{ m/s})$
- Displacement:

$$s = 0 \times 5 + \frac{1}{2} \times 2 \times 5^2 = 0 + 1 \times 25 = 25, \text{ m}$$

]

Answer: The object travels 25 meters in 5 seconds.

Tip: Always verify the physical plausibility of your answer.

2. Graphical Analysis of Motion

Problem Type: Interpreting velocity-time and displacement-time graphs.

Solution Strategy:

- Use the area under the velocity-time graph to find displacement.
- Use the slope of the displacement-time graph to find velocity.
- Identify constant acceleration from the slope of the velocity-time graph.

Example:

Given a velocity-time graph with a straight line decreasing from 10 m/s to 0 m/s over 4 seconds, find:

- The acceleration
- The total displacement during this interval

Solution:

- Acceleration:

\[

$$a = \frac{\Delta v}{\Delta t} = \frac{0 - 10}{4} = -2.5, \text{ m/s}^2$$

\]

- Displacement:

- Area under the graph:

\[

$$\text{Area} = \text{Area of trapezoid} = \frac{(v_i + v_f)}{2} \times t = \frac{(10 + 0)}{2} \times 4 = 20, \text{ m}$$

\]

Answer: The object experiences an acceleration of $(-2.5, \text{ m/s}^2)$ and covers 20 meters during the 4 seconds.

Tip: Use graphical interpretations to double-check algebraic solutions.

3. Free Fall and Gravity-Related Problems

Problem Type: Calculating the time of fall, impact velocity, or displacement during free fall.

Solution Strategy:

- Use:

\[

$$s = v_0 t + \frac{1}{2} g t^2$$

\]

where (v_0) is initial velocity (often zero in free fall).

- For impact velocity:

\[

$$v = v_0 + g t$$

\]

Sample Problem:

An object is dropped from a height of 45 meters. Ignoring air resistance, find:

- Time to reach the ground
- Impact velocity

Solution:

- Time:

\[

$$s = \frac{1}{2} g t^2 \rightarrow t = \sqrt{\frac{2s}{g}} = \sqrt{\frac{2 \times 45}{9.8}} \approx \sqrt{\frac{90}{9.8}} \approx \sqrt{9.18} \approx 3.03 \text{ s}$$

\\

- Impact velocity:

\\

$$v = g t = 9.8 \times 3.03 \approx 29.7 \text{ m/s}$$

\\

Answer: The object takes approximately 3.03 seconds to hit the ground and impacts with a speed of about 29.7 m/s.

Tip: Remember to account for air resistance only if the problem specifies it.

4. Relative Motion and Reference Frames

Problem Type: Analyzing motion of objects in different frames.

Solution Strategy:

- Use relative velocity:

\\

$$v_{A/B} = v_A - v_B$$

\\

- Consider the problem from the appropriate frame.

Example:

A train moves at 30 m/s east. A person walks inside the train at 2 m/s east relative to the train. Find the person's velocity relative to the ground.

Solution:

$$v_{\text{person/ground}} = v_{\text{train}} + v_{\text{person/train}} = 30 + 2 = 32 \text{ m/s}$$

Answer: The person moves at 32 m/s east relative to the ground.

Tip: Always define your reference frames clearly.

Before delving into specific test answers, it's essential to understand the foundational principles that govern matter in motion.

What Is Motion?

Motion refers to the change in position of an object with respect to time and a reference point. It is characterized by parameters such as:

- Distance
- Displacement
- Speed
- Velocity
- Acceleration

Types of Motion

Objects can exhibit different types of motion, including:

- Linear Motion: Movement in a straight line.
- Rotational Motion: Movement around an axis.
- Oscillatory Motion: Back-and-forth movement, such as pendulums.
- Vibrational Motion: Rapid oscillations about a fixed point.

Key Concepts and Principles in Matter in Motion

A thorough understanding of core concepts will aid in answering chapter test questions confidently.

Newton's Laws of Motion

These laws form the backbone of classical mechanics:

- First Law (Law of Inertia): An object remains at rest or moves uniformly unless acted upon by an external force.
- Second Law: The force acting on an object equals the mass of the object times its acceleration ($F = ma$).
- Third Law: For every action, there is an equal and opposite reaction.

Force and Its Types

Forces influence motion in various ways:

- Frictional Force: Opposes motion.
- Gravitational Force: Attractive force between objects.
- Tension Force: Force transmitted through a string or cable.
- Normal Force: Support force perpendicular to surfaces.

Velocity and Acceleration

- Velocity: The rate of change of displacement; a vector quantity.
- Acceleration: The rate of change of velocity; can be positive or negative.

Common Chapter Test Questions and Answers

Knowing typical questions and their answers can prepare students for exams effectively.

Sample Question 1: What is the difference between speed and velocity?

Answer:

Speed is a scalar quantity that refers to how fast an object is moving, regardless of direction. Velocity, however, is a vector quantity that includes both speed and direction. For example:

- Speed: 60 km/h
- Velocity: 60 km/h east

Sample Question 2: State Newton's Second Law of Motion and give an example.

Answer:

Newton's Second Law states that the acceleration of an object is directly proportional to the net force acting upon it and inversely proportional to its mass ($F = ma$).

Example: Pushing a shopping cart with more force results in a greater acceleration, whereas a heavier cart accelerates less under the same force.

Sample Question 3: How does friction affect motion?

Answer:

Friction opposes the motion of objects sliding or rolling against each other. It can slow down or stop moving objects and is necessary for activities like walking. Friction can be minimized using lubricants or increased by rough surfaces.

Sample Question 4: What is acceleration? How is it different from velocity?

Answer:

Acceleration is the rate at which an object's velocity changes over time. It can be positive (speeding up), negative (slowing down), or change direction. Unlike velocity, acceleration is not a displacement measure but a change in velocity.

Sample Question 5: Describe the concept of inertia and its significance.

Answer:

Inertia is the tendency of an object to resist changes in its state of motion. An object at rest tends to stay at rest, and an object in motion tends to stay in motion at a constant velocity unless acted upon by an external force. Inertia explains why seat belts are crucial during sudden stops, as they counteract the inertia of passengers.

Core Concepts in Matter in Motion

- **Types of Motion**

Understanding different types of motion is essential for answering test questions accurately. These include:

- Linear Motion: Movement along a straight line (e.g., a car moving along a highway).
- Rotational Motion: Movement around an axis (e.g., a spinning top).
- Oscillatory Motion: Back-and-forth movement (e.g., a pendulum).

- Key Quantities and Vectors

Physics describes motion using several quantities, often represented as vectors or scalars:

- Displacement: The shortest distance from the initial to the final position, including direction.
- Velocity: The rate of change of displacement, indicating how fast and in which direction an object moves.
- Speed: The rate of change of distance, irrespective of direction.
- Acceleration: The rate at which velocity changes over time.

- Equations of Motion

For uniformly accelerated motion (constant acceleration), the following equations are fundamental:

- $v = u + at$
- $s = ut + \frac{1}{2}at^2$
- $v^2 = u^2 + 2as$

Where:

- u = initial velocity
- v = final velocity
- a = acceleration
- s = displacement
- t = time elapsed

Typical Questions and Their Answers in Chapter Tests

- Multiple Choice Questions (MCQs)

Example Question:

An object starts from rest and accelerates uniformly at 2 m/s^2 for 5 seconds. What is its velocity at the end of this period?

Answer:

Using the equation $(v = u + at)$, where $(u = 0)$, $(a = 2 \text{ m/s}^2)$, and $(t = 5 \text{ s})$:

[

$$v = 0 + (2)(5) = 10 \text{ m/s}$$

]

Correct Choice: 10 m/s

Key Point:

This question tests understanding of basic kinematic equations and how to apply them to real-world scenarios.

- Calculation-Based Problems

Example Question:

A car accelerates from 20 m/s to 30 m/s over a distance of 500 meters. Find the acceleration of the car.

Answer:

Using the equation $(v^2 = u^2 + 2as)$:

[

$$(30)^2 = (20)^2 + 2a(500)$$

]

[

$$900 = 400 + 1000a$$

$\downarrow$

$\downarrow$

$$900 - 400 = 1000a$$

$\downarrow$

$\downarrow$

$$500 = 1000a$$

$\downarrow$

$\downarrow$

$$a = \frac{500}{1000} = 0.5 \, \text{m/s}^2$$

$\downarrow$

Answer: The acceleration is $0.5 \, \text{m/s}^2$.

Key Point:

This problem emphasizes the relationship between velocity, acceleration, and displacement.

- Conceptual Questions

Example Question:

Explain why an object in free fall accelerates downward at a constant rate, ignoring air resistance.

Answer:

In free fall, the only force acting on the object is gravity, which imparts a constant acceleration directed downward. Since gravity provides a uniform force, the acceleration remains constant at approximately $(9.8 \, \text{m/s}^2)$. This means the object's velocity increases uniformly over time, leading to constant acceleration.

Key Point:

Conceptual questions assess understanding of physical principles beyond calculations.

- Constant velocity motion: moving at a steady speed in a straight line.
- Accelerated motion: speeding up or slowing down along a straight path.
- Deceleration or negative acceleration.

The core principle involves analyzing how an object's position, velocity, and acceleration change over time as it moves in a straight line.

Key Concepts in Straight-Line Motion

- Displacement (d): The change in position of an object from its initial point to its final point.
- Velocity (v): The rate at which an object changes its position; can be constant or variable.
- Acceleration (a): The rate of change of velocity; can be positive (speeding up) or negative (slowing down).
- Time (t): The duration over which the motion occurs.

Common Types of Moving Straight Ahead Problems

Most homework problems related to moving straight ahead fall into categories such as:

- Constant Velocity Problems
 - Determining the distance traveled over a period.
 - Calculating time taken to reach a destination.
 - Finding the velocity when the distance and time are known.
- Uniformly Accelerated Motion
 - Using equations of motion to find displacement, final velocity, or time.
 - Problems involving acceleration, such as a car speeding up or slowing down.
- Free Fall and Vertical Motion (if specified)

- Analyzing objects falling under gravity along a vertical line.
- Calculating impact velocities or time of fall.

How to Approach Moving Straight Ahead Homework Problems

To find accurate moving straight ahead homework answers, students should adopt a systematic approach. Here's a step-by-step guide:

Step 1: Read the Problem Carefully

- Identify what is given: initial velocity, final velocity, acceleration, time, displacement.
- Determine what you need to find: velocity, displacement, acceleration, or time.

Step 2: Draw a Diagram

- Visualize the motion with a simple diagram illustrating the initial and final positions, directions, and known quantities.
- Label all known variables clearly.

Step 3: Choose the Appropriate Equations

Depending on the knowns and unknowns, select relevant equations:

- For constant velocity: $d = v \times t$
- For uniformly accelerated motion:
 - $v = v_0 + a t$
 - $d = v_0 t + \frac{1}{2} a t^2$
 - $v^2 = v_0^2 + 2 a d$

Step 4: Plug in Known Values and Solve

- Substitute known quantities into the equations.
- Perform algebraic manipulations carefully.
- Keep track of units and convert if necessary.

Step 5: Verify Your Answer

- Check if the answer makes sense physically (e.g., negative time or impossible speeds).
- Confirm units are consistent.
- If multiple steps are involved, verify each calculation.

Common Challenges and How to Overcome Them

Misidentifying Known and Unknown Variables

Solution: Create a table listing all given quantities and what needs to be found.

Confusing Equations of Motion

Solution: Memorize key equations and understand when to apply each.

Errors in Calculation

Solution: Double-check arithmetic, especially signs and units. Use calculator features to verify.

Ignoring Direction

Solution: Remember that velocity and displacement are vector quantities; specify directions.

Sample Moving Straight Ahead Problem and Solution

Problem:

A car starts from rest and accelerates uniformly at (2 m/s^2) . What is its velocity after 5 seconds? How far has it traveled in that time?

Solution:

- Identify knowns:

- Initial velocity $(v_0 = 0 \text{ m/s})$
- Acceleration $(a = 2 \text{ m/s}^2)$
- Time $(t = 5 \text{ s})$

- Find final velocity:

$\{$

$$v = v_0 + a t = 0 + 2 \times 5 = 10 \text{ m/s}$$

$\}$

- Calculate displacement:

$\{$

$$d = v_0 t + \frac{1}{2} a t^2 = 0 + \frac{1}{2} \times 2 \times 5^2 = 1 \times 25 = 25 \text{ m}$$

\]

Answer:

- The car's velocity after 5 seconds is 10 m/s.
- The distance traveled in that time is 25 meters.

Tips for Success with Moving Straight Ahead Homework

- Practice regularly: The more problems you solve, the more familiar you'll become with typical question formats.
- Understand the physics: Focus on grasping concepts rather than just memorizing formulas.
- Check units and directions: Always ensure your units are consistent and directions are correctly interpreted.
- Work systematically: Follow a structured problem-solving approach as outlined above.
- Use technology wisely: Graphing calculators and online tools can help visualize motion and verify solutions.
