 self.hash = self.calculate_hash()

 def calculate_hash(self):

 block_string = f'{self.index}{self.timestamp}{self.data}{self.previous_hash}'

 return hashlib.sha256(block_string.encode()).hexdigest()

class Blockchain:

 def __init__(self):

 self.chain = [self.create_genesis_block()]

 def create_genesis_block(self):

 return Block(0, time.time(), "Genesis Block", "0")

 def get_latest_block(self):

 return self.chain[-1]
```

```
def add_block(self, new_data):

 previous_block = self.get_latest_block()

 new_block = Block(len(self.chain), time.time(), new_data, previous_block.hash)

 self.chain.append(new_block)

def is_chain_valid(self):

 for i in range(1, len(self.chain)):

    def __init__(self):
```

```
self.chain = [self.create_genesis_block()]

self.pending_transactions = []

def create_genesis_block(self):

    return Block(0, time.time(), "Genesis Block", "0")

def add_transaction(self, transaction):

    self.pending_transactions.append(transaction)

def mine_pending_transactions(self):

    block_data = {

        'transactions': self.pending_transactions

    }

    previous_block = self.get_latest_block()

    new_block = Block(len(self.chain), time.time(), block_data, previous_block.hash)

    self.chain.append(new_block)

    self.pending_transactions = []

Validation method remains same
