- Optimization and Selection: Evaluating generated options based on criteria like weight, cost, or strength, and selecting the most suitable design.
- Validation: Performing detailed FEA on the optimized model to verify structural integrity.

Key Features and Capabilities

Topology Optimization

At the heart of generative structural analysis is topology optimization, which systematically redistributes material within a given design space. CATIA V5 enables users to specify objectives such as minimizing weight while maintaining stress limits. The software then produces a series of optimized geometries, often resulting in organic, highly efficient structures that may be difficult to conceive manually.

Parametric and Associative Design

The parametric nature of CATIA V5 allows for easy adjustments of design variables, ensuring that generated solutions can be fine-tuned to meet specific requirements. Associativity ensures that modifications in the base model automatically propagate through the analysis and optimization workflows, maintaining consistency and reducing manual rework.

Integrated Simulation Environment

The analysis capabilities are deeply integrated into the CATIA environment, enabling:

- Real-time feedback: Immediate visualization of stress distributions and deformation.
- Automated meshing: Adaptive meshing strategies that improve accuracy.
- Multi-Load Case Analysis: Simulating complex scenarios involving multiple simultaneous loads.
- Results Post-processing: Generating detailed reports, color-coded stress maps, and displacement plots.

Material and Manufacturing Considerations

Advanced features support the inclusion of realistic material behaviors, including composites and anisotropic materials. Furthermore, the software can incorporate manufacturing constraints such as additive manufacturing requirements, ensuring that optimized designs are practical and feasible.
