Common Questions and Solutions in Physics Unit VII Test V1

Below we examine some typical questions from Physics Unit VII tests and provide detailed answers and explanations.

Question 1: Describe the Properties of Mechanical Waves

Sample Question:

What are the main properties of mechanical waves, and how do they differ from electromagnetic waves?

Answer:

Mechanical waves are disturbances that propagate through a medium (solid, liquid, or gas). Their main properties include:

- Wavelength (?): The distance between successive crests or troughs.
- Frequency (f): Number of wave cycles passing a point per second.
- Amplitude: The maximum displacement from the rest position.
- Wave Speed (v): How fast the wave travels through the medium, given by $v = f\lambda$.
- Speed depends on the medium's properties: Density and elasticity influence wave speed.

Differences from Electromagnetic Waves:

- Mechanical waves require a medium to travel (e.g., air, water).
- Electromagnetic waves (light, radio waves) can travel through a vacuum.
- Mechanical waves include sound and seismic waves, while electromagnetic waves include visible light, X-rays, and radio waves.

Question 2: Explain the Doppler Effect and Provide an Example

Sample Question:

What is the Doppler effect, and how does it affect the frequency of sound waves?

Answer:

The Doppler effect refers to the change in frequency (and wavelength) of a wave as observed by an observer moving relative to the source of the wave.

- When the source and observer move closer: The observed frequency increases (higher pitch in sound).
- When they move apart: The observed frequency decreases (lower pitch).

Example:

A siren on an ambulance approaches you; the pitch sounds higher as it approaches and lower as it moves away. This change is due to the Doppler effect.

Mathematically:

$$f' = f (v \pm v_o) / (v \mp v_s)$$

Where:

- f' = observed frequency
- f = emitted frequency
- v = speed of sound in the medium
- v_o = speed of the observer (positive if moving towards the source)
- v_s = speed of the source (positive if moving away from the observer)

Question 3: Describe the Laws of Reflection and Refraction

Sample Question:

What are the laws of reflection and refraction? Provide examples illustrating each.

Answer:

Laws of Reflection:

- The angle of incidence (θ_i) equals the angle of reflection (θ_r).
- The incident ray, reflected ray, and the normal to the surface all lie in the same plane.

Example:

Light hitting a mirror reflects at the same angle it arrives, enabling images to form.

Laws of Refraction:

- The incident ray, refracted ray, and the normal all lie in the same plane.
- The ratio of the sine of the angle of incidence (θ_i) to the sine of the angle of refraction (θ_r) is constant, given by Snell's Law:

$$n_i \sin \theta_i = n_r \sin \theta_r$$

where n_i and n_r are the refractive indices of the media.

Example:

A straw appearing bent in a glass of water is due to refraction, where light changes speed as it passes from air to water.
