At the core of applied thermodynamics is the understanding of thermodynamic systems—the quantity of matter or a region in space chosen for analysis. These systems are classified into:

- Open Systems: Systems where mass and energy can cross boundaries (e.g., a boiler or a turbine).
- Closed Systems: Systems where only energy crosses the boundary, but mass remains fixed (e.g., a sealed piston).
- Isolated Systems: No mass or energy transfer across boundaries.

Thermodynamic processes describe the transformations occurring within these systems, such as:

- Isobaric (constant pressure)
- Isochoric (constant volume)
- Isothermal (constant temperature)
- Adiabatic (no heat transfer)
- Polytropic processes

Understanding these processes is vital for designing systems that operate efficiently under specified conditions.

Laws of Thermodynamics

R K Rajput elaborates on the four fundamental laws:
