Understanding NS2 and GSM Simulation

What is NS2?

NS2 (Network Simulator 2) is a discrete event simulation tool widely used for research and educational purposes in computer networks. It allows users to model various network protocols and architectures, including wireless, wired, and mixed networks.

Why Simulate GSM Networks?

Global System for Mobile Communications (GSM) is a standard for mobile telephony. Simulating GSM networks helps researchers analyze performance metrics such as:

- Call setup delay

- Handovers
- Bandwidth utilization
- Latency and jitter

This simulation aids in optimizing network design, testing new protocols, and understanding network behavior under different conditions.

Fundamentals of TCL Scripting in NS2 for GSM

Role of TCL in NS2

TCL (Tool Command Language) scripts are used to define network topology, configure protocols, and control simulation flow in NS2. For GSM simulations, TCL scripts specify:

- Number of nodes (base stations and mobile units)
